

The chart below shows the percentage of people who ate five portions of fruit and vegetables per day in the UK from 2001 to 2008.

The bar chart depicts the proportion of men, women, and children who consumed five portions of fruits and vegetables between the years 2001 to 2008.

At the first glance, it can be seen that women were consuming fruits and vegetables the highest percentage of others, while children consistently accounted for the lowest. Although all segments steadily increased throughout the whole period. Furthermore, every segment had fluctuations at a particular point.

For fruit and vegetable consumption, women were about 20% in 2001, which is higher than others' rates approximately 4% and 8% respectively. Then it rose gradually over the years and reach a peak of almost 35% in 2006. At the end of the final year, it experienced a slightly fell under 30%.

The first three years remained the same for children and men respectively more than 10% and 15%. The proportion of men gradually increased before 2006 and slightly decreased at the end of the period. whereas children's data fell after 2007 and reach a peak of around 25%. Finally, in 2008, it got around 24%.
